

In the Specification:

Please amend the top portion of page 16 of the specification as follows:

3,6-diphenyl-2,5-dihydro-pyrrolo[3,4-c]pyrrole-1,4-dione or 2,9-dichloroquinacridone and 3,6-di(4'-chloro-phenyl)-2,5-dihydro-pyrrolo[3,4-c]pyrrole-1,4-dione.

The solid solution pigments obtained in accordance with the invention have a high degree of crystallinity and optimum fastness properties, as well as high colour strength and colour saturation. Moreover, the particle size distribution is astonishingly narrow. In the case of the preferred average particle size of the conditioned pigment \bar{L} of preferably from 0.01 to 3 μm , especially from 0.05 to 2 μm , at least 90% by weight of particles have a size of $[[L]] \quad \bar{L} \pm \frac{1}{2}\bar{L}$ (for example, in the case of an average particle size of 0.2 μm , $0.2 \pm 0.1 \mu\text{m} = 0.1$ to 0.3 μm). Especially, at least 80% by weight of particles have a size of $[[L]] \quad \bar{L} \pm \frac{1}{4}\bar{L}$.
